

PENTATARD AT

OVERVIEW

Pentatard AT is a retarding agent in powder form based on natural tartaric acid.

ADVANTAGES

It is very effective in the mixtures based on cement and/or gypsum with hydrated lime.

It allows a great flexibility in managing the delay.

In gypsum-based mixtures, it develops an interval between the beginning and the ending of the setting, which is much more controllable than the one developed by the synthetic tartaric acid.

PACKAGING

25 kg paper bag.

Effects of **Pentatard AT** on the setting time of an industrial gypsum for plaster with hydrated lime
